The conveyor which converts an ascending shower of tobacco particles into a rod-shaped filler ready to be draped into a running web of cigarette paper in cigarette rod making machine employs an endless permeable belt having a lower reach disposed beneath a suction chamber and at a level above a channel for advancement of the filler toward the wrapping mechanism. The channel and the marginal portions of the lower reach of the belt are flanked by walls which consist, at least in part, of a wear-resistant ceramic material capable of standing long periods of use due to a minimal wear as a result of sliding contact with tobacco particles, even if the belt is driven at an elevated speed to advance tobacco particles past a trimming device and thereupon into the wrapping mechanism of the cigarette rod making machine.
